

Exploring Parts of the Brain

K-2

Our brain is amazing and helps us do everything, like thinking and feeling. It is split into different parts, each doing important things to help us move and learn.

Brain

The top boss is the brain, controlling our body. It takes in information, makes choices, and tells our body what to do.

Cerebrum

The cerebrum is the biggest part of the brain. It helps us think, learn, and solve problems. It also controls our feelings and lets us see, hear, and touch things.

Cerebellum

Found at the back of the brain, the cerebellum helps us move smoothly. It makes sure we walk, run, and play sports without falling over.

Prefrontal Cortex

The prefrontal cortex acts like a boss, making decisions and plans. It helps us set goals, solve issues, and think before acting.

Hippocampus

The hippocampus helps us remember things. It stores new memories and brings back old ones, letting us think about past events and facts.

Amygdala

The amygdala is in charge of our feelings. It handles emotions like fear, joy, and anger, helping us react correctly to different situations. It also helps us stay safe.

Neurons

Neurons are the brain's special blocks, carrying messages to share info. They make connections to help different brain parts work together smoothly.

Learning about the brain's parts and jobs shows us how amazing this special organ is, shaping who we are and how we see the world.
